

# Boolean Format Strings

You can specify how values are formatted for attributes of `BOOLEAN` data types.

## Built-In Boolean Formats

Format Name	Description
Yes/No	Displays Yes for true and No for false.  For numeric values, displays No if the number is 0; otherwise, displays Yes.
True/False	Displays True for true and False for false.  For numeric values, displays False if the number is 0; otherwise, displays True.
On/Off	Displays On for true and Off for false.  For numeric values, displays Off if the number is 0; otherwise, displays On.

## Custom Boolean Formats

If you choose Custom as the format, you can supply a format string to specify how to format Boolean values if the values are in numeric format (ones and zeros to represent true and false). See the custom format characters for [Number Format Strings](#).
