

Add A New Model To A Repository

Models are always created and managed within a repository. Most repositories will have just one model, but you can add as many as you want.

Multi-model repositories make sense when you have models that share objects. For example, you may create models around different facts that share common dimensions.

Procedure

To add a new model:

1. In Design Center, open the **Repo Browser** and select the **Repo** and **Branch** for the repository you want to add a model to.
2. In the **Repo Browser**, click the new object button and select **Model.yml**. A new model is added to the repository, and appears in the `models/` folder in the **Repo Browser**.
3. In the **Edit Model** pane, enter a **Unique name** for the model. This must be unique across all repositories and all subrepositories.
4. Click **Apply**.
