

Editing And Removing Row Security Objects

Editing A Row Security Object

To edit a row security object, click its context menu and select **Edit**. Note the following restrictions:

- ▶ You cannot change the security dimension's dataset
- ▶ Changing column assignments is limited to the two columns originally chosen, allowing you to effectively switch them.
- ▶ You can change the **Lookup Rules** without restriction.
- ▶ You can change the **Scope** setting without restriction.

Removing A Row Security Object From A Model

Removing a row security object from a model removes only the usage of the object. Its definition remains in the repository and is available for data modeling. If a row security object is not connected to a dimension or dataset, it is not enforced by the engine.

To remove a row security object from a model, click its context menu and select **Delete**. The row security object is removed from the Canvas, but remains available in the **Repo Browser**.

Removing A Row Security Object From A Project

To remove a row security object from a project, locate the object in the **Repo Browser**, click its context menu, and select **Delete**.

The system removes the definition of the row security object from the project, as well as all uses of the object within any models in the project.
