Extract Values From A Map

A `MAP` type column contains a delimited list of key:value pairs. Map columns are imported into AtScale as `STRING` type columns. Although AtScale does not support the `MAP` data type, you can create calculated columns from strings containing maps. This generates a calculated column formula using the `REGEXP_EXTRACT` function.

To creata a calculated column from a map, you must edit the dataset's underlying SML to include the `map` property. For more information, see Datasets.
