

Publishing Projects

This section explains how to publish an AtScale project so that its cubes are available to client connections and queries.

- ▲ [What Does Publishing a Project Do?](#) When you publish a project in AtScale, all of the cubes as they are currently defined in the project become immediately available for queries.
- ▲ [Publish a Project](#) Publishing a project publishes all of the cubes and perspectives contained in the project. You cannot publish cubes individually. When you publish, you have the option of choosing which version of the project definition to make live.
- ▲ [Unpublishing Projects](#) Unpublishing removes a project and its contained cubes from AtScale's runtime environment. Client connections and queries will no longer be able to access the project. You can only unpublish an entire project, not individual cubes of a project.
