

Data Catalog API

Using the data catalog API you can extract data about projects and data models from AtScale. Then you can upload and use this data in third-party data catalogs.

About

Enterprise data catalogs are essential tools in a self service-analytics infrastructure. They allow finding data from the various data sources available in an enterprise. If you want to integrate the models you created in AtScale with a data catalog, you can obtain the data using the Data Catalog API.

You can call the API by performing HTTP requests to the AtScale system and specifying what data you need. The system returns the requested details in SOAP format.

To use the data catalog API you must have a special AtScale license. Ask your sales representative about obtaining a data catalog API-enabled license.

API Reference

How to create requests, and read and process responses:

- ▲ [Request reference](#)
- ▲ [Response reference](#)

Requesting specific data:

- ▲ [Catalogs](#)
