

Using Tableau Cloud

You can publish a workbook to Tableau Cloud that other users can view in their browser.

Prerequisites

- ▲ Make sure the latest version of Tableau Bridge is installed. For details, see [Use Tableau Bridge](#). Note that Tableau Bridge is only available for Microsoft Windows, as described in [Plan Your Bridge Deployment](#).
- ▲ When configuring TLS, consider that AtScale requires the certificate file to contain the whole certificate chain, from root to leaf.
- ▲ Review the [Tableau tips and limitations](#).

Procedure

1. An administrator should do the following:
 - ▲ Configure AtScale, Tableau Cloud, and Tableau Bridge as needed.
 - ▲ Create user accounts with the required permissions on these systems.
2. A cube creator should create or update a cube in AtScale as described in [Working with Cubes](#).
3. A workbook creator should create a workbook in Tableau Desktop and publish it.

Optionally, the data source can be published as described in [Publish a Data Source](#). This way other users would be able to connect to it from their own workbooks.

4. A report user should now be able to use the published workbook in Tableau Cloud.

More Information

In case you are using Tableau Server, see [Publishing a Workbook to Tableau Server](#).
