

# Duplicate A Cube In A Project

If you have update permission on the project and read permission on a cube, you can make a copy of an existing cube in a project. This allows you to create new cubes using existing work as a starting point.

**Important:** This functionality is currently disabled. As a workaround, you can use the **Duplicate** feature at the project level.

## Before You Begin

Your user ID must have Read permission on the cube and Update permission on the project.

## Procedure

1. Open the project to view the project overview page.
2. From the Overview page, find the cube in the **Cubes** list, and click the **Duplicate** icon beside its name.
3. Give the new cube a unique name.
4. To set the security policy for the duplicate cube:
  - ▲ Select **Copy Security** to copy design-time and runtime security permissions to the new copy of the cube.
  - ▲ Deselect **Copy Security** to set a custom security policy for the duplicate cube.
5. Click **Copy Cube**.
