

# Webhooks For Actions On Organizations

Webhooks can be configured for organization-level events.

To navigate to the Webhooks page for an organization, select **Settings** > **Webhooks** from the left-hand menu under **Organization Settings**.

Figure 1. Webhooks landing page

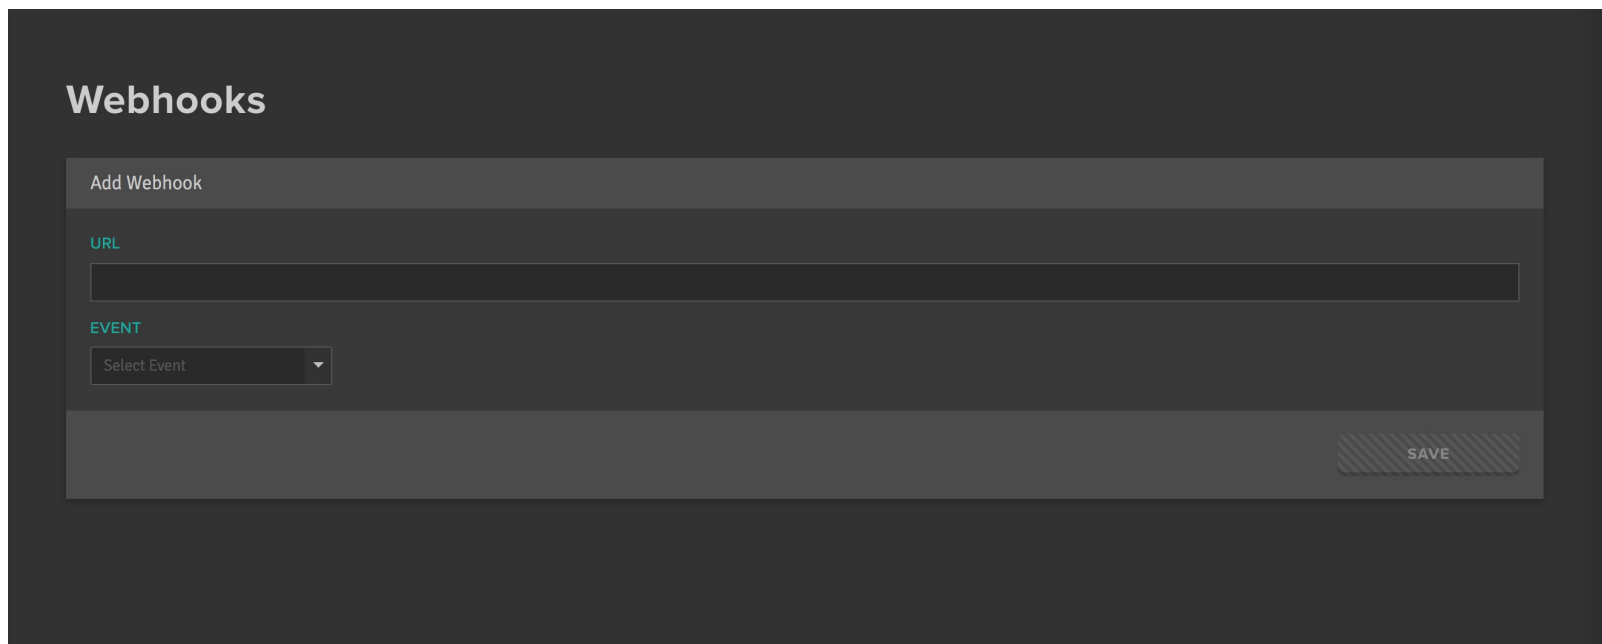

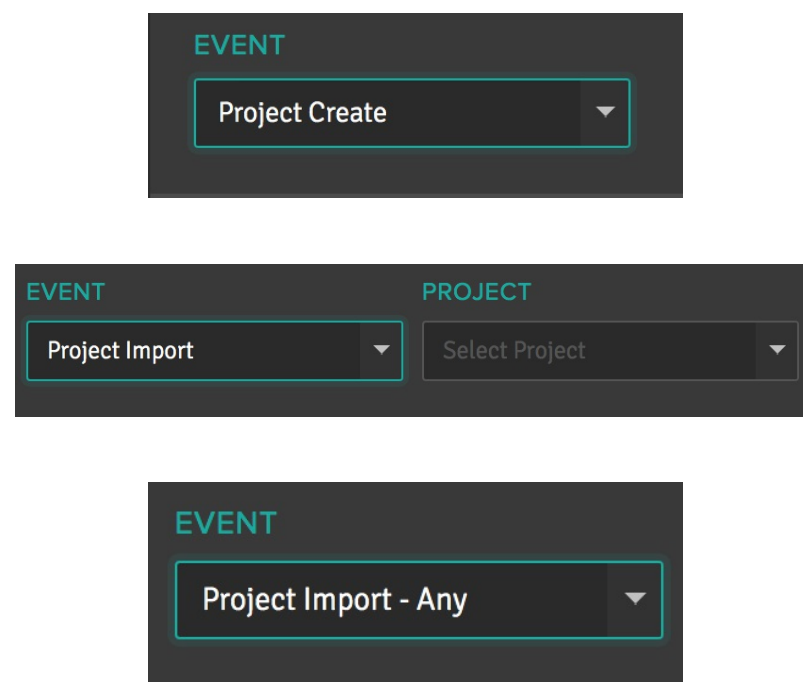

Figure 2. The Webhooks for Project Create, Project Import, Project Import (Any)

## Event: Project Create

**Purpose of webhook:** To send a callback when a project is created or imported.

**Payload:** The project's `project.xml` file.

**POST parameters:**

`userId`

The ID of the user who created the project.

`name` or `projectName`

The name that was given to the project.

`organizationName`

The name of the organization in which the project was created.

`projectId`

The UUID that AtScale assigned to the project.

`organizationId`

The UUID of the organization that AtScale assigned to the organization.

`description`

The description that was given to the project when it was created and that appears in the project's general settings.

## Event: Project Import

**Purpose of webhook:** To send a callback when a specific project is imported from a `project.xml` file or from the pasting of a specific XML file.

**Payload:** The project's `project.xml` file.

### POST parameters:

`userId`

The ID of the user who imported the project.

`name` or `projectName`

The name that was given to the project.

`organizationName`

The name of the organization into which the project was imported.

`projectId`

The UUID that AtScale assigned to the project.

`organizationId`

The UUID of the organization that AtScale assigned to the organization.

`description`

The description that was given to the project when it was imported and that appears in the project's general settings.

## Event: Project Import - Any

**Purpose of webhook:** To send a callback when any project is imported from a `project.xml` file or from the pasting of any XML file.

**Payload:** The project's `project.xml` file.

### POST parameters:

`userId`

The ID of the user who imported the project.

`name` or `projectName`

The name that was given to the project.

`organizationName`

The name of the organization into which the project was imported.

`projectId`

The UUID that AtScale assigned to the project.

`organizationId`

The UUID of the organization that AtScale assigned to the organization.

`description`

The description that was given to the project when it was imported and that appears in the project's general settings.

## Event: Login Failure

**Purpose of webhook:** To send a callback when there is a failed attempt to log in to the Design Center; for example, incorrect user name or password.

**Payload:** Simply the "Bad Login" message.

### POST parameters:

`message`

A short message about the incorrect login, including the user name used during this attempt.

`organizationId`

UUID of the organization to which the user tried to log in.

`time`

The time when the login attempt was performed, in Unix time format.

Example for the parameters in the POST request:

```
message: Bad Login [alicesmith]: Invalid username or password  
organizationId: AtScale  
time: 1643723261
```
